DNA fragments useful for increasing p53 activity in a cell and reducing susceptibility to UV-induced hyperproliferative diseases.

Claim 11; Page 30; 44pp; English

AAZ10692-97 represent DNA fragments that are used for increasing p53 activity in a cell. The oligonucleotides are are UV mimetics and protect cells against subsequent exposure to UV-irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative diseases, treating psoriasis, vitiligo, atopic dermatitis, allergic rhinitis, conjunctivitis, and UV-induced dermatoses, reducing photoaging and reducing susceptibility to skin cancer

The oligonucleotides are are UV mimetics and protect cells against subsequent exposure to UV irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV induced hyperproliferative diseases, treating psoriasis, vitiligo, atopic dermatitis, allergic rhinitis, conjunctivitis, and UV-induced dermatoses, reducing photoaging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA fragments useful for increasing p53 activity in a cell and reducing susceptibility to UV-induced hyperproliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention describes inhibition of mammalian epithelial cell

Cr proliferation by treating cells with at least one oligonucleotide, or its

fragment. The compounds, which have cytostatic, anti-allergic, anti-
inflammatory, dermatological, ophthalmological, anti-psoriatic and
immunosuppressive activities, function as 'ultra-violet mimics' to induce

cr inflammatory, dermatological, ophthalmological, anti-psoriatic and
immunosuppressive activities, function as 'ultra-violet mimics' to induce

cr adiation or chemicals, as a proliferation inhibitor, apoptosis inducer

cr a tumour necrosis factor inhibitor. Probably they mimic products of

DNA damage, or processed DNA-damage intermediates, by inducing the p53

cc pathway, resulting in transient arrest of cell growth, allowing more time

cr for DNA repair to occur before cell division takes place. The method is

cr pathway is active states (e.g. psoriasis or precancerous conditions);

reduce photoaging, oxidative stress or damage; prevent skin cancer; treat

allergically mediated inflammation (atopic or contact dermatitis,

Eller M;

Yaar M,

The invention describes inhibition of mammalian epithelial cell proliferation by treating cells with at least one oligonucleotide, or its fragment. The compounds, which have cytostatic, anti-allergic, anti-inflammatory, dermatological, ophthalmological, anti-psoriatic and immunosuppressive activities, function as 'ultra-violet mimics' to induce DNA repair processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other hyperprobliferative states (e.g. psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergically mediated inflammation (aropic or contact dermatitis, allergically mediated inflammation (aropic or contact dermatitis, allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in cells caused by radiation or chemicals; increase melanin production (pigmentation) in epithelial cells (e.g. for treating vitligg), and to promote apoptosis in epithelial cells that contain damaged DNA. Also oligonucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell. This inhibit apoptosis, and allowed the direction of the description of the direction of the data truncated sequence is melanogenesis associated cligonucleotide #4, a truncated version of the oligonucleotide shown in AAS14906, one of the oligonucleotide shown in AAS14906, one of the oligonucleotides used to inhibit mammalian epithelial cell proliferation, Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light. Sequence 5 BP; 1 A; 0 C; 2 G; 2 T; 0 U; 0 Other; described in the method of the invention Claim 1; Page 36; 74pp; English.

ö

Gaps

The invention relates to inhibiting growth of cancer cells, which is independent of presence or activity of telomerase in cells, not requiring the presence or activity of p53 normal function in cells, not resulting in S-phase arrest in cells, and inducing apoptosis in cancer cells, which involving administering a composition comprising oligonucleotides which share at least 50% sequence identity with human telomere overhang repeat, (TTAGG)n. The composition may contain 2 of the oligonucleotides (or their contiguous portion) and is used in a method inhibiting proliferation of epithelial cells in a mammal or preventing/reducing DNA damage in cells of a mammal, where the DNA damage is caused by radiation or DNA-damaging chemicals. The method is useful for inhibiting growth of cancer cells chemicals.

Claim 44; Page 6; 65pp; English.

human, promoting differentiation of malignant cells in a mammal, enhancing the expression of one or more surface antigens (e.g. MART-1, tyrosinase, TRP-1 or gp-1100) indicative of differentiation of cancer cells (especially melanoma cells) in a human and for treatment of other hyperproliferative disorders (e.g. spongiosis, blistering or dyskeratosis in the skin of a mammal, skin cancer in a human with xeroderma

(especially lymphoma, osteosarcoma, melanoma, leukaemia, cervical cancer, squamous cell carcinoma), for inducing apoptosis in cancer cells in human, promoting differentiation of malignant cells in a mammal,

RESULT 5 ACD25823/c

```
Inhibiting growth of cancer cells and inducing apoptosis in cancer cells, by administering composition having oligonucleotides that share sequence identity with human telomere overhang repeat.

```
The invention relates to inhibiting growth of cancer cells, which is independent of presence or activity of telomerase in cells, not requiring the presence or activity of p53 normal function in cells, not requiring sphere in cells, and inducing apoptosis in cancer cells, involving administering a composition comportising oligonucleotides which share at least 50% sequence identity with human telomere overhang repeat, contiguous portion) and is used in a method inhibiting proliferation of epithelial cells in a mammal or preventing/reducing DNA damage in cells of a mammal, where the DNA damage is caused by radiation or DNA-damaging chemicals. The method is useful for inhibiting growth of cancer cells (especially lymphoma, osteosarcoma, melanoma, leukaemia, cervical cancer, and a promoting differentiation of maloran in a mammal, human, promoting differentiation of maloran cells in mammal, human, promoting differentiation of malorance cells in mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

nucleic acid sequence amplification, for genetic testing or facilitating multiplex PCR amplification from limiting amounts of target nucleic acid. The methods are also useful for improving genetic diagnostic and screening methods, such as prenaral diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful in forensic analysis of degraded, old, ancient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR primer used in the selection and amplification of genetic markers
                                                                                                                                                                                             for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heterozygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for
amplification, useful for improving genetic testing, e.g. fetal sex determination, comprises selecting each of the genetic markers according
                                                                                                                                                                        The invention describes a method of selecting genetic markers as targets
                                                                                                                Claim 36; Page 40; 64pp; English.

DNA fragments useful for increasing p53 activity in a cell and reducing susceptibility to UV-induced hyperproliferative diseases. Claim 11; Page 30; 44pp; English

AAZ10692-97 represent DNA fragments that are used for increasing p53 activity in a cell. The oligonucleotides are are UV mimetics and protect cells against subsequent exposure to UV-irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative diseases, treating psoriasis, vitiligo, atopic dermatitis, allergic rhinitis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes inhibition of mammalian epithelial cell proliferation by treating cells with at least one oligonucleotide, or its fragment: The compounds, which have cytostatic, anti-allergic, anti-inflammatory, dermatological, obthialmological, anti-psoriatic and immunosuppressive activities, function as 'ultra-violet mimics' to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA repair processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other hyperproliferative states (e.g. psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light.

hyperproliferative states (e.g. psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergically mediated inflammation (atopic or contact dermatitis.

allergic rhinitis and conjunctivits); prevent or reduce DNA damage in cells caused by radiation or chemicals; increase melanin production (pigmentation) in epithelial cells (e.g. for treating vitligo), and to promote apoptosis in epithelial cells that contain damaged DNA. Also oligonucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis in response to DNA damage, in epithelial cell. This sequence is melanogenesis associated oligonucleotide #3, a truncated version of the oligonucleotide shown in AAS14906, one of the oligonucleotides used to inhibit mammalian epithelial cell proliferation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Telomere; ss; probe; cytostatic; human; antipsoriatic; dermatological; apoptosis; cancer; p53; epithalial cell proliferation; DNA damage; lymphoma; osteosarcoma; melanoma; leukaemia; cervical cancer; squamous cell carcinoma; surface antigen; MART-1; tyrosinase; TRP-1; gp-1100; hyperproliferative disorder; spongiosis; blistering; dyskeratosis; skin cancer; xeroderma pigmentosum; seborrheic keratosis; actinic keratosis; Bowen's disease; basal cell carcinoma; psoriasis; arcipic dermatitis; breast cancer; lung cancer; liver cancer; prostate cancer; pancreatic cancer; lung cancer; liver cancer; bladder cancer; trenderine cancer; brain cancer; bladder cancer; stomach cancer; thyroid cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes inhibition of mammalian epithelial cell proliferation by treating cells with at least one oligonucleotide, or its fragment. The compounds, which have cytostatic, anti-allergic, anti-allergic, anti-allergic, anti-allergic, anti-allergic, anti-allergic, anti-allergic, anti-allergic, anti-allergic and immunosuppressive activities, function as 'ultra-violet mimics' to induce DNA repair processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other
                                                                                                                                                                                                                                                                                                                                                                                                             ÷
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Melanin, melanogenic, oligomer, cytostatic, anti-allergic, p53, anti-inflammatory; dermatological; ophthalmological; anti-psoriatic; immunosuppressive; DNA repair; proliferation inhibitor; apoptosis; tumour necrosis factor inhibitor; photoaging; hyperproliferative disease; carcinoma; oxidative stress; skin cancer; allergy mediated inflammation; conjunctivitis; allergic rhinitis; vitiligo; ss.
     allergically mediated inflammation (atopic or contact dermatitis, allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in cells caused by radiation or chemicals; increase melanin production (pigmentation) in epithelial cells (e.g. for treating vitiligo), and to promote apoptosis in epithelial cells that contain damaged DNA. Also oligonucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell. This sequence is melanogenesis associated oligonucleotide #7, one of the oligonucleotides used to inhibit mammalian epithelial cell proliferation, described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light.
                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
The invention relates to inhibiting growth of cancer cells, which is independent of presence or activity of telomerase in cells, not requiring the presence or activity of p53 normal function in cells, not reguling in S-phase arrest in cells, and inducing apoptosis in cancer cells, involving administering a composition comprising oligonucleotides which share at least 50% sequence identity with human telomere overhang repeat, (TTAGG)n. The composition may contain 2 of the oligonucleotides (or their contiguous portion) and is used in a method inhibiting proliferation of a mammal, where the DNA damage is caused by radiation or DNA-damaging of a mammal, where the DNA damage is caused by radiation or DNA-damaging chemicals. The method is useful for inhibiting growth of cancer cells of a mammal, promoting actionama, per indicating apoptosis in cancer cells in cancer in a mammal, are spanned in a mammal, and in a mammal, cervical cancer cells in a mammal, and ferentiation of malignant cells in a mammal, companies, TRP-1 or gp-1100) indicative of differentiation of cancer cells (especially melanoma cells) in a human and for treatment of other hyperproliferative disorders (e.g. spongiosis, blistering or dyskeratosis in the skin of a mammal, skin cancer in a human with xeroderma pignentections affecting epithelial cells (such as psoriasis and acopic conditions affecting epithelial cells (such as psoriasis and acopic deformatitis) and also the types of cancers of breast, lung, liver, prosocate, pancreatic, ovarian, bladder, uterine, colon, brain, cesophagus, scomach, and thyroid. The present sequence is a melanogenic cellomere-like oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..
0
Inhibiting growth of cancer cells and inducing apoptosis in cancer cells, by administering composition having oligonucleotides that share sequence identity with human telomere overhang repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 5; DB 8; Length 7; 100.0%; Pred. ```
The invention relates to inhibiting growth of cancer cells, which is independent of presence or activity of telomerase in cells, not requiring the presence or activity of p53 normal function in cells, not reguling in C5-phase arrest in cells, and inducing apoptosis in cancer cells, involving administering a composition comprising oligonucleotides which share at least 50% sequence identity with human telomere overhang repeat, (T7AGG)n. The composition may contain 2 of the oligonucleotides (or their contiguous portion) and is used in a method inhibiting proliferation of epithelial cells in a mammal or preventing/reducing DNA damage in cells of a mammal, where the DNA damage is caused by radiation or DNA-damaging chemicals. The method is useful for inhibiting growth of cancer cells of cancer cells in carcinoma), for inducing apoptosis in cancer cells in chuman, promoting differentiation of malignant cells in a mammal, carcinoma), for inducing apoptosis in cancer cells in chuman, promoting differentiation of more more surface antigens (e.g. MART-1, tyrosing the expression of one or more surface antigens (e.g. MART-1, tyrosing the expression of one or more surface antigens (e.g. MART-1, tyrosing the expression of one or more surface antigens (e.g. MART-1, tyrosing the expression of one or more surface antigens (e.g. MART-1, tyrosing the expression of one or more surface antigens (e.g. MART-1, tyrosing the expression of cancer in a human with xeroderma or promoting the expression of cancer in a human with xeroderma propertion and also the types of cancers of breast, lung, liver, conditions affecting epithelial cells (such as psoriasis and atopic demartits) and also the types of cancers of breast, lung, liver, conditions affecting epithelial cells (such as psoriasis and atopic demartities) and also the types of cancers of breast, lung, liver, prosected, prosected, prosected, and thyroid. The present sequence is a truncated conditions affecting epithelial cells in the invention or sequence is a truncated conditions and

This is a nonamer consensus sequence of a cyclin D transcription factor DMP1. DMP1 is an amino acid polymer which has binding affinity for a D-c type cyclin, in vitro, and for a specific DMA nuclectide sequence and is a transcription factor involved in the activation of genes that prevent cell proliferation. The DMP1 nucleic acid is operatively linked to an expression control sequence in an expression vector. The expression control sequence comprising this nonamer ceptor has a transcription control sequence comprising this nonamer ceptor as a transcription control sequence comprising this nonamer ceptor in a chromosome of a transgenic animal. A probe or a cassette insertion site for a recombinant gene. The vector is homologously recompetitor in DMP1 transactivation assays is designed based on this competitor in DMP1 transactivation assays is designed based on this competitor in DMP1 transactivation assays is designed based on this companied in a chromosome of a transgenic animal. A probe or a competitor binding of DMP1 as probe to DMP1 as probe to DMP1 where the probe under conditions that allow binding of the probe under conditions that allow binding of the probe contains the core sequence GTA, and where the probe to DMP1 is suspected in the sample. DMP1 can concentraling the expression of DMP1 can be used to treat tumours and other concented. The presence or activity of DMP1 can be used to treat tumours and other concented by the probes of DMP1 in cells is useful for detection of cancer cells or inhibit can detection of cancer cells or inhibit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The parent calsoloses in-inceptants that bind a transposase, a transposase-encoding polynucleotide operably linked to a regulatory sequence comprising an operator, that alters expression of the response encoding polynucleotide. Transposon sequences can integrate transposase-encoding polynucleotide. Transposon sequences can integrate into genomic DNA whether or not the cell is dividing. AdSB10 is a SB (Sleeping Beauty) transposase-transducing adenoviral non-integrating of vector. The non-integrating viral vectors are useful for treating genetic disease characterised by subnormal production of a polypeptide or RNA, or supplementation of a metabolic activity. These genetic diseases include cystic fibrosis, diabetes, cardiovascular disease, cancer or nucleic acid delivery systems, e.g. for genome analysis or gene therapy and can also be used for applications that involve long-term production of a polypeptide. The non-integrating viral vectors are also useful for creating transgenic host cells that provide normal cells with protection against toxic side effects of chemocherapy. The sequence of the present invention is a direct repeat sequence that binds to SB protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Non-integrating (adenovirus-based) viral vectors useful in gene therapy, especially for treating patients suffering from a genetic disease, e.g. cystic fibrosis, diabetes, cardiovascular disease, cancer or brain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a promoter regulatory element, found in the utrons of the invention. Utrons are from, or are homologous to, the 3' untranslated region (UTR), of an mRNA that stimulates or inhibits a cellular response by sequence specific interactions. The utron is able to suppress constitutive and interferon-gamma (IFN-gamma) induced major histocompatibility complex (MHC) class I and class II antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifs that are stimulated by the same factors which stimulate MHC class I and class II antigen expression. Such utrons can be used to regulate gene expression in a subject, e.g. a human or a cell in vitro, specifically inhibiting MHC Class I or II, ICAM-7, B7-1, B7-2, FC gamma R, IL-2 or HIV gene expression. They can be used to inhibit transcribant rejection, or treat an autoimmune or inflammatory disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Utrons, RNA molecules containing promoter regulatory motifs - useful to suppress express expression from promoter of interest, specifically TSU nucleic acid suppression of MHC Class I and II gene expression.
                                        A promoter regulatory motif found in the utrons of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 20; Page 20; 200pp; English

[Aloo | Lib="Zebrafish Washu MPING EST"]

[Aloo | Lib="Zebrafish Washu MPING EST"]

[Aloo | Lib="Yearly repeated to Sal | Ladaptors | Lib Strand cDNA was pined with a Not I - oligo(dT) is primer | Extrand cDNA was ligated to Sal I adaptors (BEL), digested with Not I and cloned into the Not I and Sal I sites of the pSPORTI vector (BEL). Library was constructed by Matthew Clark (Lehrach lab, ICRF, London and Max Planck Institut fuer Molekulare Genetik, Berlin). London and Max Planck Institut fuer Molekulare Genetik, Berlin). CDNAs for EST analysis were selected following oligonucleotide hybridization fingerprinting of arrayed clones from zebrafish late somitogenesis (26 ss), adult liver or embryonic shield stage (5.6 h) libraries. Fingerprint data were used to computationally cluster CDNAs, and a single cDNA from each cluster were sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single clones

Me are not submitting the same cDNA sequence redundantly to DDBJ

since 1993. For the abundance information of clones with this

sequence in this library and as well as in other 3'-directed

libraries, see 'http://www.imcb.osaka-u.ac.jp/bodymap'. The

sequences of the clones represented by this GS sequences is also

found there.

/note="Vector: pT713D-Pac (Pharmacia) with a modified
polylinker; lst strand cDNA was prepared from 3 pooled
germ cell tumors, and was then primed with a Not I -
oligo(dT) primer. Double-stranded cDNA was ligated to Eco
RI adaptors (Pharmacia), digested with Not I and cloned
into the Not I and Eco RI sites of the modified pT7T3
vector. Library is normalized. Library was constructed by
Bento Soares and M. Fatima Bonaldo."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 11, A Sequence 17, A Sequence 1, A Sequence 8, Ap Sequence 80, A Sequence 68, A Sequence 623, Sequence 2220, Sequence 2220, Sequence 37, A
